

Title: Bridging the Gap between Community and Cardiologists

AUTHOR : Biplab Jamatia, Assistant Professor, School of Health Sciences, Indira Gandhi National Open University, Maidan Garhi, New Delhi-110068; India. E-mail: biplabjamatia@gmail.com

ABSTRACT

Cardiovascular diseases are an emerging cause of morbidity and mortality in India. India produces less than 150 cardiologists annually leading to a gap between the need and availability of trained professionals. Three years cardiology training programme is available for post graduate doctors in conventional medical education system. Majority of the people living in rural/small town/district town of the country do not have any access to cardiac care because trained cardiologists are mostly concentrated in the metro or capital cities. To address this issue Indira Gandhi National Open University has designed and developed a two-year full time training programme in the area of non-invasive cardiology named Post Graduate Diploma in Clinical Cardiology for medical graduates which is being offered through the open and distance learning mode. The objective of the programme is to train large number of medical graduates effectively to enable early recognition, management and prevention of common cardiovascular diseases. Learners have been given opportunity to train in different departments and posted in various areas like management of common cardiovascular diseases (6 months), ECG and Stress Testing (3 months), Echocardiography (3 months), ICU/CCU management (6 months), Paediatrics Cardiology (3 months), preventive cardiology (3 months) in this programme. Self learning materials, 33 video programmes (1260 minutes) and monthly live interactive teleconference (90 minutes) has been incorporated in this programme. Beside these, 50 theory counselling sessions, 25 guest lectures, seminars, journal club and case discussion has been taken care in every training center. Hands on skills training is provided to every learner as prescribed in this programme. The 72 credits programme is divided into 7 theory and 6 practical courses. Students need to pass in each course independently both in internal examination and term end examination. Minimum teacher-student ratio has been maintained strictly in both training and term end practical examination. The top most cardiac institutes/hospitals across the country have been identified as training centers as per the norms of the University. This programme has begun with 116 students in 16 training centers in 2006. 443 students have been enrolled in 67 training centres in 2013. More than 320 cardiologists are involved as academic counselors in this training programme. 773 candidates have successfully completed their training and a majority of them are providing services in small or district town of the country.

Key words: Cardiology, Post Graduate Diploma in Clinical Cardiology, School of Health Sciences. Training non-invasive cardiology through ODL mode

INTRODUCTION

Cardiovascular diseases are the most important causes of morbidity and mortality in developed countries. But in developing countries such as India, in addition to the infectious diseases, non-communicable diseases (NCDs) like cardiovascular diseases have also emerged as significant causes of morbidity and mortality.¹

The increased prevalence of cardiovascular diseases the world over, and particularly in India, is because of changing life style and increased life expectancy attributed to the improved healthcare system. Cardiovascular diseases namely ischaemic heart disease, cerebrovascular disease, rheumatic heart disease (RHD) etc. are responsible for 27 percent of all deaths in the South-East Asia Region.²

In a review conducted in 1996 (published in the Annual Report 2006 – 2007, Ministry of Health and Family Welfare, Government of India, p. 152-153), it was reported that the prevalence of coronary heart disease (CHD) had increased from 1 percent in 1960 to 9.6 percent in 1995 among urban Indians. Similarly, the prevalence among the rural residents of India rose from 2 percent in 1974 to 3.7 percent in 1995. The prevalence of CHD is now (2006- 2007) reported to be 3 – 4 percent in rural areas and 8 – 10 percent in urban areas among adults. Based on this official data, it is estimated that there were approximately 29.8 million patients with CHD in the year 2003. With an estimated 10 percent attrition and event rate the Annual Report, projected an annual new event or death of 2.9 million persons per year with nearly 1.5 million people dying due to CHD every year. Cardiovascular diseases attributed to 25 percent of death among the adult population in 2005.³

To take care of the burden of the disease, the present health infrastructure of India produces less than 150 DM/ DNB cardiologists annually⁴. In the conventional education system of the medical stream, DM/DNB in cardiology is a 3 - year fulltime super specialist training programme. A Medical School Graduate (an MBBS) needs to complete a 3 - year post graduation in General Medicine/Paediatrics after completion of the five and half years graduation training programme (MBBS) to be eligible for Cardiology training i.e. DM/DNB in cardiology.

Most Doctors trained in cardiology were located in the metros/ big cities as infrastructure, finance and clinical practice are easily available as opposed to a rural or small/District town set up. Hence, trained cardiologists are mostly concentrated in the tertiary setups located in metro/big cities leading to a gap between the need and availability of trained cardiologists. But health or cardiovascular diseases do not distinguish either between rural and urban population, or the rich and the poor. National Health Profile 2005 (National Health Profile 2005, p 28 & 8) reported that in India an approximate 26 percent of population live below the poverty line and more than 72 percent live in rural areas.⁵ Post graduate doctors in medicine (MD) attend to cardiovascular cases in district/small towns and rural areas without the appropriate training in cardiology, as, a Post Graduate Doctor in Medicine undergoes training in the department of cardiology for only 4-6 months in his 3 years training period.

In keeping with the prevalent medical scenario in mind, this paper seeks to critique the two- year full time training programme conceptualised, designed and developed by the School of Health Sciences, Indira Gandhi National Open University New Delhi, India. This programme is offered through the open and distance learning system in an effort to bridge the gap between the community at large and trained cardiologists. It needs to be re-iterated that this programme was planned with a certain vision in mind, that of providing good cardiac care to all, and in keeping with this vision, the programme was designed and extra advantage was given to medical doctors serving in non metros with the hope that even if, 20 percent of the trained cardiologists serve to the district level town, then the community at large will benefit from their expertise.

METHODOLOGY

To meet the objective outlined earlier, the School of Health Sciences (SOHS), Indira Gandhi National Open University (IGNOU) launched a two-year full time training programme in non-invasive cardiology for MBBS Graduates in June 2006. The programme being discussed is the Post Graduate Diploma in Clinical Cardiology (PGDCC). It is a 72 - credit programme consisting of seven theory and six practical courses with 58 percent credit dedicated to the practical component. One credit in the IGNOU system of teaching/ learning methodology is equivalent to 30 hours of study. However, in the PGDCC programme, 1 credit/ 30 hours of study translates into 30 hours of supervised training and does not include the time that one may take to study at home or to write his/ her assignments. It means students are receiving approximately 3 hours (2160 hours / 730 days) supervised hand on skilled training or theory counselling every day. This programme also prescribes about the minimum number of cases need to be practice under supervision like echocardiography 100 cases, bedside paediatric 20 cases etc. Learners need to

maintained log book of their day to day practical activity which is assessed by academic counselors periodically and at the time of term end practical examination.

Table 1: Posting Schedule of the PGDCC Programme

Area of Training	Duration of Training
First Year	
Wards + OPD (MCCL* 003)	3 Months
ECG/Stress Testing (MCCL 001)	3 months
Echocardiography (MCCL 002)	3 months
ICU/CCU (MCCL 006)	3 months
Second Year	
Special Observation (MCCL 006)	1 month
ICU/CCU (MCCL 006)	2 months
Ward+ OPD (MCCL 003)	3 months
Paediatric Cardiology (MCCL 004)	3 months
Preventing Cardiology (MCCL 005)	3 months

*MCCL is Practical training course code

The selection process of the candidates was through entrance examination followed by centralized counselling. The number of seats in each Programme Study Centre is limited to a maximum of 10. This Programme began with 16 PSCs activated in 2006 and due to the great demand for more seats; the number of PSCs was increased to 67 in 2013. The programme fee is Rs. 100,000/- Indian Rupees or an approximate US\$ 1667/- (if US\$ 1 = Rs. 60/- Indian Rupees).

The academic counsellors who counsel the students are full fledged trained cardiologists (DM/DNB Cardiology) already working in PSCs. Training package of this programme consist of self learning materials (SLMs), theory and practical classes/academic counselling at PSC, case discussion, monthly live interactive teleconference, interactive radio counseling and the broadcast of video programmes. Special hands on training is imparted on electrocardiography (ECG), stress testing, echocardiography, out patient department (OPD) and ward management of cardiovascular diseases, paediatric cardiology, intensive coronary care, cardiac emergencies and community posting. All training is imparted in reputed cardiac hospitals across the country.

A minimum of 50 theory sessions of academic counselling must be conducted within two years of training period. Each learner must present eight seminars, 8 journal club and 9 case discussions. PSC must arranged 25 of guest lectures of the leaners to understand different areas associated with non-invasive cardiology. The 25 guest lectures were further divided into six in Diabetes mellitus, five in Pulmonology, four in Radiology, four in Cardiac Surgery, four in Anesthesiology and two in nephrology. Live interactive teleconference which is one way video and two ways audio has been conducted for 90 minutes every month. This live teleconference session is also webcast besides broadcasting through Gyandarshan 2 channel. Students from across the country participated and lots of interaction took place during the live teleconference session. Short Message Service (SMS) service is utilized to inform the schedule and topic of teleconference session, date of examination, result and other support services. A total of 33 video programmes (1260 minutes) has made available to all learners. It is mandatory for students to maintain a minimum of 85 percent attendance in both the theory and practical components independently.

The evaluation strategy of this programme consists of continuous as well as Term End Evaluation for both theory and practical courses. Continuous Evaluation has 50 percent weightage and is conducted at the PSC at intervals of 3 to 4 months. The first year theory term end examination is to be attempted only after completing a full academic year of training. The second year term end theory examination is to be attempted at the end of the two -year training period. Term End Practical Exam is conducted after the completion of the two- years training period. One day term end practical examination is conducted in the PSC or other PSC depending upon number of the

learners in the presence of internal and external practical examiners. The number of examiners is depends on the number of learners appeared in the practical examination (ratio 1:3). The marking scheme of the term end practical examination is standardized and followed for assessment of each learner.

QUALITY ASSURANCE

A monthly/quarterly/annual academic training calendar for both the theory as well as the practical component, prepared by the respective PSC is sent to the Regional Centre and Programme Coordinator in the headquarter at IGNOU. Meetings are also arranged with the Programme in-charges (PICs) at national level annually in order to monitor the quality of training and improve upon the programme every year. The Mailing addresses, phone numbers and E-mail ids of the Programme Coordinator, Regional Director, Programme In-charges (PICs) and other support divisions are distributed to all learners, PICs and Academic Counsellors. The Programme Coordinator also receives continuous feedback and suggestions from students, PICs, and Regional Directors through various media. Advisory Board of the PGDCC programme also provides support in monitoring activity.

Table 3: Total number of Programme Study Centre, academic counselors, students enrolled and passed out in the PGDCC programme

Year	Number of the Programme Study Centre	No of the Academic Counsellors	Number of the students Enrolled	Number of the candidates successfully completed this programme [Year of Convocation]*
2006	16	102	116	----
2007	22	150	133	----
2008	35	206	253	88
2009	44	261	262	101
2010	56	278	297	194
2011	66	320	348	210
2012	66	320	209	180
2013	67	325	443	

*A lag of 2-4 years in certification as valid registration period is 2-4 years; like students enrolled in 2006 will complete their programme in 2008.

It needs to be highlighted that this PGDCC two- year Programme is a highly intensive programme that entails a student – teacher ratio of approximately 2:1. The strength of this programme is that doctors are trained for 2 years on a full time basis in non-invasive cardiology in which all hands - on skill training are guided by trained and experienced cardiologists. Training is implemented only in cardiac institutes and most of the institutes already have DNB cardiology training programmes. Learners are benefited by not only ODL system but also the support of conventional education system. Since students are directly attached to a cardiac institution on full time basis academic counsellors are available round the clock for expert guidance in theory as well as practical components of training in cardiology. Students are also getting benefit of all the support of the university such as self learning materials, multimedia packages, live interactive teleconference

etc. However, the one major weakness of the Programme as visualised by us is the non-recognition by the Medical Council of India.

CONCLUSION

An academic degree of a Diploma in Clinical Cardiology is viable after a medical graduation degree/ MBBS. This programme has in a sense brought to light the fact that quality training even in a traditionally non open and distance learning area such as in cardiac care is not only possible but also highly desirable through the Open and Distance Learning System in convergence with the partnership of reputed cardiac institutes in the country. It needs to be highlighted that such a programme is also not available in the conventional medical education system and is a first for both medical education as well as the ODL. Not only this but the PGDCC programme is also the first and only full time medical education programme for medical graduates (MBBS) in the world to be imparted through the ODL system.

Already 773 candidates have successfully completed their training till date. As per informal feedback from the passed out PGDCC candidates, majority of them were doing successfully practice in non invasive area in district town. The vision also included a bridge to be built between the community (particularly the rural and non-metro community) and cardiologists through the ODL System and a fond hope that the medical professional/ personnel would also be able to fulfill some of their social responsibilities.

RECOMMENDATION

This is an innovative programme that is still in the evolving phase. The programme team is working constantly towards enriching the training package in order to produce quality doctors trained in cardiac care for the community. Advisory Board of the programme recommended revision of the curriculum of the programme along with building on line platform with learning management system.
